

KuantorFlow — a guide for learners

Build your English, word by word. KuantorFlow is a vocabulary workshop for Ukrainian- and Russian-speaking learners of English. You look words up, keep them as bilingual flashcards, practise them, and talk to Mykola, an AI study companion, about anything you do not understand. This is a short tour of everything the site can do.

Getting in

The site opens with a **keyword**. Type the one you were given and it lets you through; that pass is remembered until you clear it.

Past the gate you can read and practise everything anonymously. **Signing in with Google** adds three things: you can add cards, your settings are your own rather than the shared defaults, and Mykola knows what to call you. Without an account you can still browse, quiz and play; what you cannot do is write. The controls stay on the page and tell you why they are greyed rather than quietly disappearing.

The header carries **Home**, **About**, and **Settings** — a popup described at the end of this guide, and also where two heavier buttons live: *Reset Auth*, which clears the keyword and your sign-in together and is how you hand the browser back, and *Delete account*, which asks first whether your cards should go with you or stay for other learners.

Building your deck

Look up a word. Type it, name a topic, and press *Look up & save*. KuantorFlow asks a translator and an English dictionary at once, and builds **one card per part of speech**: record the noun and record the verb are different words in every way that matters, so they are kept apart. A card holds the English word, its part of speech, an English definition, authentic dictionary examples, and translations into Ukrainian and Russian. If a word is already in your deck you are warned before it is looked up again.

Unless you have asked for cards to be saved automatically, the results arrive in a **review popup** first. Every field is editable there — fix a translation, cut an example, then *Add* the cards you want or *Add All*.

Upload notes. If your vocabulary already lives in a file, hand it over: `.txt`, `.docx` and `.mht` are all read, including OneNote pages pasted from Reverso Context. The file is parsed into proposed cards and shown in the same review popup, side by side with its own text, so you can see where each card came from before you keep it.

Your deck

The front page lists the **topics**, grouped into sections and shown as tiles with a card count. A topic you invent by naming it in a lookup is filed under *Other*; the curated **B2–C1 Conversational Topics** section holds the eighteen topics the starting deck is built from. You can also type a topic name straight into the box.

Opening a topic gives you the **flashcard list** — every card in full, with its definition, examples and translations. Each card carries a **speaker button**: press it to hear the word read aloud by a voice your device already has. On a card you added you can **edit** any field, **move** it to another topic, or **delete** it; other people's cards you can read but not change.

The *Card deck* link at the top of that list opens the same topic as a **card deck**: one card at a time, click to flip it between the English side and the translation, arrows to move through the pile, and a *Flip animation* switch if you would rather it did not turn.

Practising

Every activity starts with the same picker: tick the topics you want, choose **how many words** the round should ask (ten by default), and start. The choice is remembered for next time, and the round's address is a plain link you can bookmark or share. Every topic page carries the same activities in a row along the top, already narrowed to that topic.

Quiz. You are shown a word and you **type the translation**. There is no multiple choice: producing a word is harder than recognising one, and it holds much better. Answers are marked generously — any accepted translation counts, case and spacing are ignored, and *ë* and *e* are treated alike — and a wrong answer shows you what was expected. A switch in the page takes the same quiz in your other language.

Real or fake. Half the words are yours and half were invented by a model trained on your own deck, and you decide which is which. **Scrambled** shuffles the middle letters of a word and asks you to put it back together.

Three more activities are declared but **not yet built** — *Multiple choice*, *Fill the gap*, and *Generate a text*, which will write a passage using your own words. Their tiles are visible and greyed, so you can see what is coming without being able to click into an empty room.

Mykola, your study companion

Mykola sits in the corner of every page. Ask him what a word means, how two words differ, why a sentence sounds wrong, or for a translation — and your language settings apply to his answers as well as to your cards. He can also **read your deck**: which topics you have, which words are in one of them, and what a particular card says, so "let's practise my *Work and careers* words" is a fair thing to ask. He can **save a card** for you in the middle of a conversation, and if you tell him what you would like to be called he remembers that too.

If you have been away for a few hours he starts a fresh conversation and opens it with a short **recap** of where you left off, rather than pretending to remember everything or forgetting it all.

Settings

Setting	What it does
Add cards automatically	Skip the review popup: <i>Look up & save</i> writes straight to the deck. Off by default.
Show only my cards	Hide everyone else's cards from every page. Off by default — the deck is shared.
Translator	Google Translate or Bing Translator.

Explanatory dictionary	Oxford or Merriam-Webster.
Ukrainian / Russian	Hide a language everywhere: on the cards and in Mykola's answers.
Quiz language	The language a quiz opens in. The in-page switch still takes it in the other.
Restart chat after	Hours of silence before Mykola starts a fresh conversation with a recap. Zero means never.
Fast thinking	Mykola deliberates less and answers shorter and quicker. On by default.
Type his answer out	His reply is typed out as it arrives instead of landing in chunks. On by default.

Settings belong to your account and follow you between devices. Signed out, you can see them but not change them.

The idea behind it

A card here is a **lexical entry**, not a word-and-translation pair. The translation is a fast bridge into memory; the English definition and a real dictionary example then make you handle the word in English, and both stay on the card long after the translation stops being necessary — which is why you can hide the translations once they are in the way. The deck is made of words *you* met, in the topics you chose, and vocabulary met in real life is remembered far better than somebody else's list.
