

Showing KuantorFlow to an English teacher

Plan for the week · 13 September 2026 · target: before the end of next week

No correctness blockers left. Both demo blockers closed — #231 (Oxford missing *can* and *do*) on 28 August, #258 (*Real or fake* marking a right answer wrong) on 30 August. So this week is **verification and polish, not building**.

The week, in order

1 Worksheet print layout — #340

DONE

Printed the worst case: 40 blanks over 865 words. Four pages, every blank intact, **no blank split across a page**, answer key alone on the last sheet. No code needed.

2 Say it out loud when the credits run out — #99 + #19

NEXT

One PR, two tickets, one deploy. Turn the silent credit failure into a sentence with your top-up email, and put a first-time-user tip above *Look up & save*. Your teachers *are* first-time users.

3 Popup polish — #75, then #208 #84 #120 #227

IF TIME

#75 is one number, affects more than the ticket claims, and lets two workarounds be deleted. Individually trivial; together they are the difference between “a project” and “a product”.

4 The *General* topic — #147

IF TIME

It holds the oldest, messiest cards, misspelled headwords among them. Look at production first: #407 and #414 may have changed it already, and **hiding it for the demo may beat fixing it**.

The morning of

- ☐ ★ **Check the Anthropic credit balance.** — the single most likely way the demo goes wrong. Mykola just stops answering, with no error.
- ☐ ★ **Hard-refresh after the last deploy** (Ctrl+F5). — a cached stylesheet renders a *plausible wrong page*, not a broken one. You wrote the CSS; you would not notice.
- ☐ ★ **Look up one word, confirm translations come back.** — the failure that looks like nothing at all.
- ☐ **Play each game once, on the deck you will show.** — cheaper than any test, and how the last three real bugs were found.
- ☐ **Decide which of the four things you are leading with.** — the deck, the lookup, the games and Mykola are four different pitches.

What to show, in this order

1. **Generate a text, then the worksheet.** Their vocabulary becomes a reading passage, then a printable gap-fill. *Lesson preparation* — the one feature a teacher would use even if their students never touched the site.
2. **A round URL is already a homework assignment.** Paste `/games/spell_it/play?topic=Health` into a class chat and it *is* the homework. No code — it just has never been said out loud.
3. **One deck, ten activities.** One vocabulary set drilled ten ways, without re-entering the words per exercise.
4. **Notes upload.** Their existing word list becomes a deck without typing it in.
5. **Mykola — last.** The thing that impresses and the thing most likely to wobble. Lead with the lesson material.

Say the gap before you are asked. A teacher will want to know how their students are doing within five minutes. Nothing records that yet — #338 is the foundation and is not built, and there is no teacher–student relationship at all. Saying so early beats being caught by it.

Deliberately not before the demo

#418 — split app.py	A refactor with nothing a teacher can see, and the largest effort on the board. Just as valid in October.
#338 — recall memory	Waiting on two decisions, and invisible until its second phase.
#199 — open the site	The launch blocker, not a demo blocker. The gate stays on; you hand over the keyword.
#92 / #94 — spaced repetition	The feature a teacher is most likely to ask for <i>by name</i> . Worth promising, not worth starting this week.
