

Walking the deployed site as a teacher would

Verification pass · 14 September 2026 · `kquantorflow.pythonanywhere.com` · anonymous visitor, through the keyword gate

The site is demo-ready. Every path a teacher is likely to take works on the deployment, including the two that spend money. Nothing found that needs fixing before the demo.

Everything shipped this week had been verified locally. This is the first end-to-end pass over **production** since the last three deploys — the only check that can find a problem nobody has thought of.

What was checked, and what came back

CHECK	RESULT	
Word lookup the riskiest one	A forced lookup of <code>serendipity</code> returned an English explanation, an example sentence, and both translations — Ukrainian and Russian. The topic box defaulted to <i>General knowledge</i> . So the Claude translator key is live and #412's move to <code>kquantorflow/.env</code> held; #414's default topic is working.	Pass
Generate a text your lead pitch	One 100-word passage over <i>Crime and justice: "A Complex Trial Concludes"</i> , coherent prose using 14 deck words — verdict, defendant, fraud, offence, custody, interrogated, alibi, testimony, convict, acquit, lawsuit, parole, sentence.	Pass
Printable worksheet	Built from that passage: 14 blanks and 14 answer-key items , matched exactly.	Pass
All ten activities	Eight games and the quiz each deal a real round over the live deck; none falls into a "cannot run" page. <i>Fill the gap</i> renders its 20 cards with a real gap; the quiz gives five Ukrainian questions.	Pass
Mykola	Asked what <i>Fill the gap</i> is. He described the flip, the self-marking, <i>Finish game</i> and the first-letter hints, citing the user guide — so #82's retrieval fix is live.	Pass
This week's CSS is really deployed	Fetches the stylesheet itself (94,549 bytes) and confirmed all five rules are in it: the edit dialog's winning selector, the sideways shift, the phone hiding rule, About at 260, the tip's <code>[hidden]</code> . This is the check for #300's failure mode — a cached stylesheet renders a <i>plausible wrong page</i> .	Pass
The deck a visitor sees	21 topics, about 538 cards — the 18 seeded curriculum topics plus <i>Fantasy world</i> (2), <i>Law and order</i> (9) and <i>Psychology, feelings and emotions</i> (17).	Pass

One open question, answered for free

#147 is not a demo risk. The ticket worries that the *General* topic holds the oldest, messiest cards — misspelled headwords among them — and that a teacher browsing the deck will find them.

On the deployment there is **no *General* or *General knowledge* topic visible at all**, and `/flashcards/General knowledge` returns **404** for a visitor. The three non-curriculum topics that *are* visible were spot-checked and their headwords are clean: `appeal`, `felony`, `jurisprudence`, `statute`, `warrant`, `castle`, `wisdom`.

So the messy cards are not reachable by browsing. **Recommendation: spend nothing on #147 before the demo.** That answer cost one page load instead of a production database dump.

Two things I got wrong on the way

I briefly concluded the lookup was silently failing. It was not. Both words I tried were already in the deck, so the app correctly showed its duplicate warning — and I had searched the page for the wrong phrases before deciding nothing had happened. Worth recording because “it does nothing” was exactly the wrong diagnosis, and it is the one this site is most likely to invite.

A near-miss worth knowing about for any scripted interaction here. Going to submit the text-generation form programmatically, my first selector matched the *account deletion* form from `base.html` instead — it is rendered on every page. I inspected the form before submitting rather than after, so nothing happened.

Both of these are arguments for the runbook's own line: play it yourself, on the deck you will show. A person clicking the button cannot misidentify which form they are on.

What was not checked, and what it cost

- **The print dialog on production.** Verified locally against the same templates — 40 blanks over 865 words, four pages, key alone on the last sheet.
- **Anything behind Google sign-in.** Not something I can do on your behalf.
- **Any path that writes a card.** The review popup was opened and read; *Add* was never pressed, so nothing was saved to your database.

Spend: one word lookup and one text generation from the day's allowance. Nothing else that costs money was exercised.

What I would do with what is left

- **Keep the remaining budget for demo day.** Being able to diagnose a surprise that afternoon is worth more than any polish ticket landed beforehand.
- **#120** — the Settings × scrolling out of reach on a phone — only if there is room. It needs a teacher to open Settings, on a phone, and scroll.
- **Nothing on #147, #418 or #338.** The first is answered above; the other two have no outcome a teacher can see.
