KuantorFlow — a guide for learners

Build your English, word by word. KuantorFlow is a vocabulary workshop for Ukrainian- and Russian-speaking learners of English. You look words up, keep them as bilingual flashcards, practise them, and talk to Mykola, an AI study companion, about anything you do not understand. This is a tour of everything the site can do.

Mykola reads this guide himself, so anything described here is something you can simply ask him about.

Getting in

No password to get in

The site is open. There is nothing to type before you can use it — open the page and the deck, the games and Mykola are all there. The site used to ask for a keyword; it no longer does.

What is open is *reading and practising*. Adding anything of your own still needs an account, and the paid parts of the site — looking a word up, generating a text, talking to Mykola — have daily limits, which are smaller for a visitor who has not signed in. Those are described under **Daily limits** below.

Signing in

You can read and practise everything anonymously. **Signing in with Google** adds three things: you can add cards, your settings are your own rather than the shared defaults, and Mykola knows what to call you. It also raises every daily limit.

Without an account you can still browse, quiz and play. What you cannot do is write — no adding, editing, moving or deleting cards. The controls stay on the page and tell you why they are greyed rather than quietly disappearing, so nothing looks broken.

Reset Auth and deleting your account

The header carries **Home**, **About**, **Help** and **Settings**, and Settings is also where two heavier buttons live.

Reset Auth signs you out **and** clears what this browser has stored — your conversation with Mykola and any saved state. That is the difference between it and simply signing out, and it is how you hand the browser back to somebody else.

Delete account removes your account, and asks first whether your cards should go with you or stay in the shared deck for other learners. The record of your answers in the games goes with it either way. It is not reversible.

If your account is blocked

An account can be blocked, for example for spam in the chat. A blocked account can still **read and practise everything**: the flashcards, the card deck, the games and word lookups, and its own settings still save. What it cannot do is change the shared deck (adding, editing, moving or

deleting cards, uploading notes) or talk to Mykola, whose chat button disappears. **A short notice at the top of every page says so**, with the address to write to for access back. It goes away on the first page you open after the block is lifted.

Help: this guide on the site

Help in the header opens this guide as a page on the site, with the sections listed at the top so you can jump to the one you need. The same guide is also there as a PDF to download, if you would rather keep a copy. Mykola reads this same guide, so the Help page and what he tells you always agree.

Building your deck

Adding a flashcard: look a word up

This is how you add a card. Type the word, name a topic — the box offers the topics you already have, and a name it does not know becomes a new one — and press *Look up & save*.

KuantorFlow asks a translator and an English dictionary at once, and builds **one card per part of speech**: `record` the noun and `record` the verb are different words in every way that matters, so they are kept apart. A card holds the English word, its part of speech, an English definition, authentic dictionary examples, and translations into Ukrainian and Russian.

If a word is already in your deck you are warned before it is looked up again. The same word and part of speech is only ever kept once, anywhere in the deck.

A lookup asks paid services, so it is not unlimited: signed out you get three words per visit, and then an invitation to sign in. Signed in you have fifty a day, which is more than a study session needs and is there to stop a runaway loop rather than to ration you. There is also a shared daily allowance for everyone at once — see *Daily limits* below, which lists all of them and explains which is which when you are turned down.

The review popup

Unless you have asked for cards to be saved automatically, the results arrive in a **review popup** first. It names the topic they are going to, and every field is editable — fix a translation, cut an example — then *Add* the cards you want, or *Add All*. Each word carries a speaker button here too, so you can hear it before deciding to keep it.

The word itself has a **pencil** beside it. A word parsed out of a file is whatever the file said — a stress mark, a typo, a stray letter — and a wrong word cannot be looked up, cannot be found in a text by the games, and is pronounced wrongly by the speaker. Press the pencil, fix it, and the card follows: what gets saved, what *Look up & update* asks for, and whether the card is marked as one you already have.

Cards you already have are marked before you press anything. **Already in DB** beside a word means that word *and that part of speech* is saved already. **Word already saved** means you have the word under a different part of speech, so this card would be added beside the ones already there; hover either label for the whole sentence.

Press *Add* on a marked card and KuantorFlow asks first, so a press is never spent by surprise. *Add All* asks once for the whole batch instead, and offers to add only the words that are new.

Saying yes really adds it: KuantorFlow keeps the card you had and saves the new one beside it, so the word ends up with two cards and you can delete whichever you like less. Saying no leaves

your deck exactly as it was. Only a card you confirmed is added this way — an ordinary *Add* on a word already in your deck is still skipped, and says so.

Uploading notes

If your vocabulary already lives in a file, hand it over: `.txt`, `.docx` and `.mht` are all read, including OneNote pages pasted from Reverso Context. The file is parsed into proposed cards and shown in the same review popup, side by side with its own text, so you can see where each card came from before you keep it.

Uploading needs an account, and there are ten files a day. Reading a file is itself a paid step — working out which lines are words and which are translations sometimes asks a language model — so the limit is checked **before** the file is opened. That is why a refusal arrives at once rather than after a wait.

Building a whole topic from an idea

Type what you want a topic to be about — *"renting a flat in London, especially the paperwork"* — say how many words you want, and the app proposes a topic name and a list of words at the same B2–C1 level as the rest of the deck.

Nothing is saved or looked up yet. You get the list first, and you can rename the topic, untick words you do not want and see how many dictionary lookups the rest would cost against your daily allowance. Words that no dictionary seems to have are flagged and unticked for you, and a word your deck already holds is pointed out so you can decide.

When you press **Build the topic**, the words are looked up one at a time and the cards appear as they arrive. It takes about 4 seconds per word, so you can watch or come back later. If a word turns out to have no entry anywhere it is skipped and named at the end rather than stopping the rest, and if your connection drops the cards already saved stay saved — start again and only the words still missing are looked up.

You need to be signed in, since only an account can save cards.

Adding more words to a topic

A topic you like can grow. On its page, press **Add more words**, say how many you want (3 to 20, ten to start with) and, if you like, what kind: *"more verbs"*, *"the paperwork side of it"*, *"words a landlord would use"*. The app suggests new words that fit the topic and leaves out every word it already has.

From there it works like building a topic from an idea: you see the list first, untick what you do not want, and see what the lookups will cost before anything is spent. **Add to the topic** looks the words up one at a time and puts the cards straight into this topic.

Suggesting the words counts as one generated text towards your daily limit, and each word you keep is one dictionary lookup. You need to be signed in, and a private topic can only be grown by the learner who made it.

Your deck

Topics and sections

The front page lists the **topics**, grouped into sections and shown as tiles with a card count. A topic you invent by naming it in a lookup is filed under *Other*; the curated **B2–C1 Conversational Topics**

section holds the eighteen topics the starting deck is built from. Click a section's heading to fold it away when you are not working on it, and it stays folded on that device until you click it again.

Private topics

Every topic starts **public**: the deck is shared, and that is the point of it. A topic you created can be made **private**, and then only you can see it — it disappears from everybody else's front page, their games and their chat with Mykola, and its address answers *not found* if they have kept the link. The one exception is the site's admin, who can see every topic in order to look after the deck, so the honest promise is *only you and the admin*.

The switch is on the topic's own page, beside its heading: **Topic visibility**, *Public* or *Private*. It changes as soon as you choose, and only the person who created the topic sees it at all.

Two things it will refuse, and both say why. A topic holding cards **other people added** cannot be made private, because that would take their own cards out of their deck — move those cards elsewhere first. And a private topic cannot be made public again while a public topic of the same name exists, since two public topics cannot share a name; rename one of them first.

A private topic *may* share its name with a public one, or with somebody else's private topic. Your own always wins: type that name when saving a card and the card goes to yours.

The flashcard list

Opening a topic gives you every card in full, with its definition, examples and translations.

Hearing a word

Each card carries a **speaker button**: press it to hear the word read aloud by a voice your device already has. Nothing is downloaded and nothing is sent anywhere — it is your browser's own speech.

Editing, moving and deleting

On a card you added you can **edit** any field, **move** it to another topic, or **delete** it. Other people's cards you can read but not change. Moving is how a card ends up in a better topic than the one you first thought of; the card itself never changes, only where it lives.

The card deck

The *Card deck* link at the top of a topic opens the same cards as a **deck**: one at a time, click to flip between the English side and the translation, arrows to move through the pile, and a *Flip animation* switch if you would rather it did not turn.

Printing or downloading a topic's words

Under every topic's title are **Print word list** and **Download (.csv)** (and, when you are signed in, **Add more words**, described above). **Print word list** opens the topic's words as a handout: each word with its part of speech, its English explanation and its translations, ready to print, or to save as a PDF from your browser's print dialog. A box there adds one example sentence per word. The list shows the languages you have chosen to see in Settings.

Download (.csv) saves the same words as a spreadsheet file that opens in Excel or Google Sheets, with every column kept, whichever languages you hide. It is yours to keep: nothing about it depends on the site staying up.

Both contain exactly the cards the topic page shows you, and anyone who can open a topic can take its words, signed in or not. Where an explanation or example comes from Wiktionary, the printout marks it and names the source at the bottom, and the file says so in its last two columns; that credit is the condition of copying Wiktionary's text.

Practising: the games and activities

The games, in one list

There are ten activities on the front page — most of them games. **All ten are ready to play.**

Game	What you do
Quiz	Type the translation of a word.
Multiple choice	Pick the English word for a translation, out of four.
Real or fake	Decide which words are real and which the app invented.
Scrambled	Rebuild a word whose middle letters were shuffled.
Generate a text	Read a passage written from your own words.
Fill the gap	Guess the word missing from one of its own example sentences.
Odd one out	Three words come from one topic and one does not; spot the stranger.
Spell it	You are shown what a word means and how it starts, and you type it.
Rebuild the sentence	The words of an example sentence, shuffled; put them back in order.
Listen and type	The word is spoken and you write it down.

Each game is described below, and they all start the same way, from the picker.

Choosing what to practise

Every game starts with the same picker: tick the topics you want, choose **how many words** the round should ask, and start. Whole sections can be ticked at once, and the running total tells you how much you have selected before you commit to it.

The choice is remembered for next time, and the round's address is a plain link you can bookmark or share. Every topic page carries the same activities in a row along the top, already narrowed to that topic.

Start stays greyed out until your selection is big enough, and the message beside it says what is missing — sometimes more cards, sometimes more topics. *Odd one out* needs at least two topics however many cards they hold, because the odd word has to come from somewhere else.

A round can be shorter than you expected

Some games need more from a card than others: *Spell it* needs an English explanation, *Rebuild the sentence* and *Fill the gap* need example sentences, and the quiz and *Multiple choice* need a translation in the language you picked. Not every card has all of those.

So a round will sometimes ask fewer questions than the number you set, and when that happens **it says so and tells you what was missing** — the cards are not gone, they just cannot be used for

that particular game. If none of the cards you chose can be used, the round says that instead of showing you an empty page, and offers the picker back with your topics still ticked.

Printing a round

Any game or quiz page prints cleanly with your browser's **Print** (Ctrl+P, or ⌘P on a Mac), which can also save it as a PDF. The site's header, Mykola and the buttons are left off, and the top of the page says which game it was, **which topics you played** (or that it was a review) and the date. On the results page every question is marked ✓ or ✗, so a black-and-white printout still shows what you got right.

What the site remembers about your answers

When you are signed in, KuantorFlow keeps a record of **your answers in the games**: the word, which game asked it, whether you got it right, and when. It is kept so the site can learn which words you already know and which you are about to forget, and bring those back to you before you do — the idea behind spaced repetition.

Most of it comes from the games that mark your answer themselves: the **Quiz**, **Multiple choice**, **Scrambled**, **Spell it**, **Rebuild the sentence** and **Listen and type**.

Fill the gap is recorded too, but differently, because there you mark yourself. When you press **Finish game**, every card you turned over is kept — ticked as remembered or not — and a card you never flipped is left out, since you never saw its answer. Your own ticks will count for **less** than an answer the site checked when it decides which words to bring back: *I did not remember it* is taken at your word, while *I remember it* moves a word along more slowly than a correct answer would.

Odd one out and *Real or fake* are not recorded, because their questions are about topics and invented words rather than about one of your cards. If you practise without signing in, nothing is recorded at all.

The record is about you alone, and other learners cannot see it. You can — on **My progress**, described below. **Deleting your account erases it** along with the account.

Words that are due come up first

From your answers the site works out, for every word you have played, **the day it is next worth asking** — soon for a word you missed, further off each time you get it right. When you are signed in, the games use that: **words due today, and words you have never answered, are dealt first**, and a word you already know for now comes up several times less often. It is never left out altogether, so a topic you know well still plays in full.

This applies to the Quiz, **Multiple choice**, **Scrambled**, **Fill the gap**, **Spell it**, **Rebuild the sentence** and **Listen and type** — every game whose question is one of your cards. *Odd one out* and *Real or fake* still draw at random. Without signing in, every game draws at random, as it always has.

Review: the words due today

When you are signed in and some of your words are due, the **Practise your words** panel on the front page shows a **Review (N due)** button, where N is how many words are waiting. It opens a page listing them — the ones waiting longest first, with how many days each is overdue — and the games you can review them in.

Pick a game and you play an ordinary round of it, dealt **only from today's list**, with the longest-waiting words most likely to come up. Your answers are checked and recorded exactly as in any

other round, and that is what moves each word to its next date: a word you get right comes back after a longer gap, and a word you miss comes back tomorrow. When the round is over, **Back to review** returns you to the list.

Today's list stays the same until tomorrow, so you can review it in as many games as you like. A word you have already answered today stays on the list with a ✓ *reviewed today*, and the next game deals the words you have not reviewed yet first. The button follows your progress: *Review (4 of 7 left)* part-way, *Review (7 done today)* once you have answered them all. Playing a word again the same day is practice — only your first answer of the day moves its date. The day starts at 4 a.m. Kyiv time, and the next morning's list is whatever is due then, including any word you missed today.

A game can only use a word it has what it needs for — *Spell it* needs an English explanation, *Rebuild the sentence* an example sentence — so a review round may be shorter than the list, and says so. If none of the due words fits a game, the page says that and lets you pick another. Only words you can still see in your deck are counted, so a word whose card has been deleted is never promised.

With nothing due, the button is not shown, and the review page tells you the day your next word comes due.

My progress: what you know, and a report for your teacher

When you are signed in, **My progress** shows what you have done and which of your words you know. It is in the header beside *Help* on a computer, and on the front page beside *Review* everywhere, including on a phone. It is built from the record of your answers described above, so it covers what you have played while signed in.

- **Summary.** How many of your words are **known** (you will be asked again in a week or more), **learning** (answered, with a shorter gap) and **struggling** (forgotten twice or more and not yet back to a week), and how many are **due today**.
- **The last 14 days.** On which days you practised, how many rounds, and how many answers were right.
- **By game and by topic.** Rounds and accuracy for each game, and known, learning, struggling and due words for each topic.
- **Your words**, grouped as above, with how many times you have answered each and when it will next be asked.

Topics and dates at the top narrow the whole page. Tick some topics — for example only one course's — and, if you like, choose **From** and **To** dates, such as this term. With dates, the page lists the words you practised in that period, counts only that period's answers, and shows each word as you know it **today**; the activity table covers the dates instead of the last 14 days. Leave the dates empty for everything since your first answer.

Download as PDF opens your browser's print dialog: choose *Save as PDF* as the destination. The file leaves off the site's menus and buttons, and adds your name, the dates it covers, the topics it was narrowed to, a one-line key to the words *known*, *learning* and *struggling*, and the site's address, so a teacher can read it without the site. **Nothing is shared unless you send the file yourself**: the site has no teacher accounts and shows your report to nobody else.

It does not include what you did without signing in, or *Odd one out* and *Real or fake*, which record nothing. *Fill the gap* is included, but its "right" is your own tick, and the page says so.

Quiz

You type the answer: there is no multiple choice, because producing a word is harder than recognising one, and it holds much better. The quiz works **both ways round**. Choose which under **Which way** when you pick the topics, beside the language, or change it during the quiz with the ⇄ button between the two boxes at the top of the page (the left box is what you see, the right one what you type):

- **English → Ukrainian (or Russian):** you see the English word and type its translation. Any accepted translation counts, case and spacing are ignored, and *ë* and *e* are treated alike.
- **Ukrainian (or Russian) → English:** you see the translation and type the English word — the harder direction, and the one that speaking and writing need. Each question gives a hint, such as *noun · starts with "r"*: the part of speech and the English word's first letter. Case, extra spaces and hyphens don't matter (*well being* counts for *well-being*), and because one translation can belong to several English words, **any word in the topics you are playing that shares the translation counts**: answer *dismissal* where the card says *resignation* and it is marked right, with the card's own word shown beside it.

A wrong answer shows you what was expected. The language box opens a menu for your other language. Changing either deals a new set of words — the page asks first only if you have already typed an answer — and the direction you chose is kept while you stay on the site, so the Quiz opens the same way next time.

Multiple choice

You are shown a Ukrainian or Russian translation and you **pick the English word** out of four. Which language the prompts are in is chosen in the picker, alongside the topics, and the whole round is graded when you submit it.

The wrong answers are not random noise. They are real words from your own deck, preferring ones spelled similarly to the answer where your deck happens to have any — and **one of the four options is misspelled**, generated from the keyboard as an adjacent key or two letters in the wrong order, so it looks exactly like a slip you might have made yourself.

How many options are misspelled changes from question to question — usually none at all, now and then one or two, and rarely three. Most questions are four correctly spelled words, so you cannot assume there is an odd-looking word to find.

When there is one, it usually sits **right beside the word it was made from**, and that word can be a wrong answer or the right one — wrong ones slightly more often, so that a misspelling of the word you are actually learning is the rarer case. `customs` next to `vustoms` and `custody` next to `custodt` look identical as a shape and mean opposite things, so a near-identical pair tells you nothing about which of the two is being asked for. The only way through is to know the word.

Cards with no translation in the language you chose are left out of the round, and the page says how many that was.

Real or fake

A game of spotting invented words. Half the words are yours and half were invented by a model trained on your own deck, and you decide which is which. The invented ones are built to look like plausible English rather than nonsense, so it is a real test of what you recognise.

Because the model learns from English, it sometimes invents a word that turns out to be real — usually a rare or technical one. So on the results page, every word the game called invented

carries **Check in a dictionary**. Press it and KuantorFlow asks Wiktionary, then Oxford:

- **it is a real word** — you were right, your score is corrected, and nobody is offered that word as invented again;
- **neither dictionary has it** — said plainly as *not proof*, because dictionaries do miss rare words;
- **it could not be checked** — the connection failed, which says nothing about the word.

Only during the results, never mid-round.

Scrambled

A game of unscrambling: the middle letters of a word are shuffled and you put it back together. The first and last letters stay, so the shape you recognise survives. Words too short to scramble are left out of the round rather than shown unchanged, and the page says how many that was.

Fill the gap

A game of guessing a word from its own dictionary example. The front of each card is a real example sentence with the word cut out of it; flip the card to see the word, with its English explanation — or its translation, when the card has no explanation.

You mark yourself: tick **I remember it** on the ones you knew, and the count in the corner keeps score. **Finish game** is there from the first card, not only the last, so you can stop whenever you like and still see how you did. If you are signed in, finishing also records the cards you turned over, as described under *What the site remembers about your answers*.

The words you did not remember come back in the next round. When you finish and press **Play again**, the cards you turned over without ticking are dealt again, mixed in with fresh ones — up to half the round, so a hard round does not simply repeat itself. A word you remember next time drops off the list; one you miss again stays on it. This works whether or not you are signed in, and it lasts only while your browser is open: it is for practising within one sitting, and has no effect on when a word comes up for review.

If the gap is too hard, ask for a letter. In the picker you can choose to see the **first letter** of the missing word, or the first *and* the last — `r___`, or `r___n`. The dashes **hint at the size** without giving it away — a longer word gets a longer run, but there are far fewer dashes than letters, so you cannot count them to find the answer. An expression is shown word by word, so *take for granted* becomes `t___e f___ g____d`: you can see it is three words, and roughly how long each one is, but not exactly. A word of three letters or fewer keeps its last letter hidden even in the second mode, because showing both ends of a short word is most of the word.

The default is **no hint at all**, exactly as before — you only see letters if you ask for them. Like the other before-you-start choices, it is made in the picker rather than on the card: being able to reveal a letter of the word you are stuck on is not a hint, it is the answer arriving late.

A card can only appear here if one of its examples actually contains its own word, so a card with no examples sits the game out and a round can be shorter than you asked for. It says so when that happens. How many cards a round deals is the **Words** number on the page where you choose topics, as in every game. When you start it straight from a topic's flashcards page, or from a review, there is no box to type in, and *Cards per round* in Settings is the number instead.

Odd one out

Four words, three of them from the same topic. You pick the one that does not belong.

This is the only game that asks about **your topics** rather than about a single word, so it needs at least **two topics ticked** — the stranger has to come from somewhere. The Start button says so if you have only picked one.

Where it can, the game takes the stranger from a topic in a different section, because *Sport* against *Law* is a fair question while *Business and work* against *Money and finance* is closer to a coin toss.

When you finish, every question is shown again with **the topic each word came from** — including the ones you got right. That is the point of the game rather than a nicety: a word can honestly belong to two topics, and *negotiation* would not look out of place under either *Business and work* or *Crime and justice*. The game can only ask about the grouping **your deck** actually has, so it tells you what that grouping was instead of leaving you to argue with the screen.

Under every word you also see **what it means**: its English explanation, or, for a card that has none, its translation in the language you chose under *Quiz language* in Settings (or the other language you show, if the card has no translation in that one). So the results double as a quick review of all the words in the round.

One thing it will never do is use a word that sits in both topics as the stranger — that would make the question unanswerable rather than hard.

Spell it

You are shown **what a word means and how it starts**, and you type the word. Every other activity goes from a word to its meaning; this one goes the other way, which is harder and is the direction that fails in an exam.

The word is shown as dashes, **one dash per letter**, with the first letter given: `u _ _ _ _ _ _`. In the picker you can ask for the last letter too — `u _ _ _ _ _ l` — which is easier, so that mode only uses words of five letters or more. You choose before the round starts rather than during it: being able to reveal the last letter of a word you are stuck on is not a hint, it is the answer arriving late.

Showing the number of letters is deliberate. You have already been told the meaning, so the length is not the answer — and if you know the word, counting dashes tells you nothing you did not know.

Dictionary explanations often contain the word they explain, or a form of it. Those are **masked too**, so a question never gives itself away. That is why you will sometimes see a second run of dashes inside the meaning.

Answers are marked the way the other typed games mark them — capitals, extra spaces and a trailing full stop are forgiven. A different form of the word is not: *resigned* for *resign* is wrong, because spelling the exact word is what this practises.

Rebuild the sentence

One real example sentence, with its words shuffled into a pool. You put them back in order.

Tap a word to place it, and tap a placed word to send it back — there is no dragging. It works the same with a mouse, a finger or the keyboard, and on a phone it is far easier than trying to drag a small word into a small gap.

This is not *Scrambled* with bigger pieces. That one shuffles the letters inside a word and practises spelling; this shuffles the words inside a sentence and practises **word order** — which is where

Ukrainian and Russian speakers most often lose marks, because both languages allow orders that English does not. A sentence that feels perfectly natural to write can still come out wrong.

Two things are left as they were written. The **full stop is removed**, so the last word does not announce itself. The **capital letter stays**, because lowercasing the first word would mangle every sentence starting with a name or *I* — you can use it to find the beginning, and everything after it is still yours to work out.

If a sentence uses the same word twice, either arrangement of those two words is accepted — they are genuinely interchangeable.

Listen and type

The one activity that makes a sound. A question is a **play button and a box** — the word is never written down, which is the whole exercise. Press play, listen, and type what you heard. You can replay a word as many times as you like: listening is the skill, not memory.

Nothing plays by itself, ever. The first sound happens when you press, which is what makes it work on an iPhone as well as anywhere else.

The voice comes from your **browser**, not from KuantorFlow — nothing is recorded, downloaded or sent anywhere. That also means it depends on what your browser has installed: Chrome, Edge and Safari ship English voices, and if yours has none, the page says so rather than showing you buttons that do nothing.

It is not a pronunciation reference. Browser voices range from good to robotic, and a dictionary is better if you want to know exactly how a word is said. This is for practising whether you can *catch* a word you already know.

Answers are marked the way the other typed games mark them — capitals, extra spaces and a trailing full stop are all forgiven. A word that merely sounds the same is wrong: telling *their* from *there* by ear is exactly what this drills, and the results show you each word with its meaning, so a word you misheard is one you also learn.

Generate a text

The one activity that **writes** rather than tests. Pick topics, optionally say what the text should be about — *a letter of complaint to a hotel*, *a news report*, *a conversation between two colleagues* — choose a length between 50 and 400 words, and read a passage built from a dozen or so of your own words.

The passage comes with a title of its own, and the words you are studying appear **in bold** — in the title as well as the text. Underneath is the honest account: which of them the text actually used, and which it did not. They are found by searching the finished text, not by asking the model to mark its own work, so the list is checked rather than claimed.

A text is kept for the session, so re-reading it, going back to it or refreshing the page costs nothing; writing a new one is a button you press deliberately. Signed out you get one text, and then an invitation to sign in; signed in, ten a day. Shared daily allowances apply as well — see *Daily limits*.

You can take the text with you. The **copy button** in the bottom-right corner of the passage copies it with the bold words intact, so pasting it into a document or an email keeps them; pasting into a plain box gives you the words. **Print the text** puts the title and the passage on a sheet of their own — no menus, no lists, no forms — and Ctrl+P does the same. Printing to PDF is your browser's usual "Save as PDF" destination in that dialog.

Mykola, your study companion

What he can answer

Mykola sits in the corner of every page. Ask him what a word means, how two words differ, why a sentence sounds wrong, or for a translation — and your language settings apply to his answers as well as to your cards. He can also explain the site itself, since he has read this guide.

Reading your deck

He can look at your deck: which topics you have, which words are in one of them, and what a particular card says. So *"let's practise my Work and careers words"* is a fair thing to ask. He sees only the cards you can see — if you have hidden other people's, they are hidden from him too.

Saving a card in conversation

He can **save a card** for you in the middle of a conversation, and if you tell him what you would like to be called he remembers that too.

If the word is already in your deck he will say so and tell you which topic it is in, rather than adding a second copy. He will not move it for you — that one you do yourself, from the card.

What Mykola cannot see or do

He cannot see the translations on your cards, by design. If you ask whether a card's Ukrainian or Russian translation is right, he will say he cannot see that translation from where he sits, and point you at the card itself. He will not claim to have saved something he has not, and he will tell you when he cannot do a thing rather than agreeing and quietly failing.

How many messages you can send

Talking to Mykola costs money every time, and more than anything else here — he answers with a much larger model than the rest of the site uses, so one message costs roughly what thirty generated texts cost.

Signed out you get ten messages in a visit, and there is a shared daily allowance across everyone signed out. Signed in you have forty a day of your own, and there is a further allowance shared by everybody. Signing in **raises** the limit rather than removing it.

One message can be up to **2,000 characters** long, which is plenty for a question or a paragraph you want to talk about. The box stops at that length and shows a count as you get near it.

If he tells you he has answered a lot of questions today and asks you to try again tomorrow, that is the shared allowance rather than yours — you have done nothing wrong, and signing in will not get past that one. *Daily limits* below has all four features and explains which refusal is which.

Recaps

When you are signed in, Mykola can look back over your last few conversations and remind you where you left off. Press **Recap our last chats**, just above the message box, whenever you want one. He does not do it by himself: a recap is written by the same paid AI as his answers, so it happens only when you ask. The button goes away once you have pressed it, since one recap per conversation is enough, and comes back when you start a new chat.

The recap is typed out as he writes it, like his answers. With *Fast thinking* on (the default) it is a short one, a sentence or two and two ideas for what to do next; turn it off for a fuller look back.

If you have been away for a few hours, he starts a fresh conversation, so a new day does not open in the middle of an old one. How long that silence has to be is yours to set. The fresh conversation begins with his ordinary greeting, and the recap button is there if you want to pick up the thread.

A recap is a paid answer like any other, so there are five a day. If there is nothing to look back on yet, or you have used the day's five, he says so — nothing is broken, and nothing is lost.

Settings

Setting	What it does
Add cards automatically	Skip the review popup: *Look up & save* writes straight to the deck. Off by default.
Show only my cards	Hide everyone else's cards from every page, and from Mykola. Off by default — the deck is shared.
Sort topics alphabetically	Order the topics inside every section by name. On by default. Turn it off and the B2–C1 topics run in the order the deck was built in, from the ones a learner meets first towards the ones they meet last.
Translator	Claude, Microsoft Translator, DeepL or Google Cloud Translation. Only the ones this site has a key for can be chosen; the rest are greyed out and say which key they need.
Explanatory dictionary	Oxford Learner's, which needs no key and is the default. Wiktionary needs no key either, and knows far more rare and technical words — its definitions are written for a general reader rather than for a learner, so it is the one to switch to when Oxford has nothing for the words you are meeting. It also brings the short usage sentences its editors write, where it has them. A card built from it says so underneath the definition, and links the entry: Wiktionary is written by volunteers and shared under a licence that asks anybody reusing it to credit them. Merriam-Webster is greyed out unless this site is configured for it, and says which key it needs — the same rule the translators follow.
Ukrainian / Russian	Hide a language everywhere: on the cards and in Mykola's answers.
Quiz language	The language a quiz opens in. The in-page switch still takes it in the other.
Cards per round	How many cards *Fill the gap* deals when you start it from a topic's flashcards page or a review, between 5 and 50. Ten by default. From the page where you choose topics, the **Words** box decides.
How fast words are spoken	The speed of the spoken word, from 50% to 150% of normal. Applies to the speaker button on your cards and to *Listen and type*. The voice itself comes from your browser, so what it sounds like depends on which browser you use.
Restart chat after	Hours without writing (1 to 24) before Mykola starts a fresh conversation. Tick *Never restart chat automatically* to keep one conversation going.
Fast thinking	Mykola deliberates less and answers shorter and quicker, and his recaps are shorter too. On by default.
Type his answer out	His reply is typed out as it arrives instead of landing in chunks. On by default.

Settings belong to your account and follow you between devices. Signed out, you can see them but not change them.

Daily limits

Why you might be asked to come back tomorrow

Five things on this site cost money every time you use them: looking a word up, generating a text, talking to Mykola, a recap of your past conversations when you ask for one, and importing a file of notes. They call paid language services, and KuantorFlow pays for them.

So each of them has a limit. The limits are there to stop a runaway loop — a script, a stuck button, somebody leaning on *regenerate* — rather than to ration you. A normal study session does not come near them.

There are three of each, and it is worth knowing which one you have met, because they mean different things.

	Looking a word up	Generating a text	Talking to Mykola	A recap	Importing notes
Signed out, per visit	3	1	10	needs an account	needs an account
Signed out, per day, shared by everyone signed out	150	20	15	—	—
Your account, per day	50	10	40	5	10
Everyone together, per day	250	60	40	10	40

Building a topic, or adding words to one, uses two of these. Suggesting the words counts as one generated text, and each word you keep is one lookup. The page shows how many lookups you have left before you approve the list.

Signing in raises a limit rather than removing it. That is true of every one of them, and it is deliberate: an account is not a licence to spend without end, it is a bigger allowance and a way for the site to tell you apart from a script.

Mykola's numbers are the small ones, and that is not arbitrary. He answers with a much larger and more expensive model than anything else here — one message costs roughly what thirty generated texts cost. Forty messages a day is a comparable amount of money to sixty texts, not a lesser welcome.

When you are turned down, the wording tells you which limit it was:

- *"...Come back tomorrow for more."* — your own day is spent. You have the whole allowance again tomorrow.
- *"Sign in with Google to keep chatting, or come back tomorrow."* — the shared allowance for signed-out visitors is spent. Signing in gives you your own, so this one has a way forward today.
- *"KuantorFlow has ... a lot today. Please try again tomorrow."* — everybody's allowance is spent. **You have done nothing wrong**, and signing in will not help, because an account draws on this pool too. It is the one limit that is genuinely about the site rather than about you.

An administrator can change any of these, and setting one to zero turns it off.

Privacy: what the site keeps

This is the whole picture, in plain words: what KuantorFlow keeps about you, who can read it, what is sent to other services, and how to delete it.

What the site keeps about you

Without signing in, almost nothing is tied to you. Your games, your chat with Mykola and your settings are not saved on the server under any name. Your conversation with Mykola is kept only in this browser, so it is still there when you come back, and *Reset Auth* clears it.

When you sign in with Google, the site keeps:

- **Your account:** the name, email address and Google account number that Google passes on when you sign in, and the name you asked Mykola to call you, if you did.
- **Your settings**, in a small file of their own.
- **The cards you add.** They join the shared deck, so other learners can see them, unless you put them in a private topic.
- **Your answers in the games**, so the site can bring words back before you forget them. This is described under *What the site remembers about your answers*.
- **Your conversations with Mykola**, described below.

Activity logs, for everybody. Like most websites, KuantorFlow writes a short line for each thing that happens, so that problems can be found and fixed. For example: a card saved, a word looked up, a file uploaded (its name, not its contents), the idea you typed to build a topic, a round played and its score, a topic's word list printed or downloaded, a setting changed. If you are signed in, **the line includes your email address**. There is also a short line for **each page you open**: which page, how long it took to load, and, if you are signed in, your account number, not your email address. The logs never contain what you say to Mykola. They are started afresh every 30 days, and **each one is deleted automatically after about a year**.

Your conversations with Mykola

If you are signed in, your conversations are saved on the server under your account. That is how Mykola can sum up where you left off when you ask him for a recap. This is the only place the text of your messages is stored.

If you are not signed in, nothing you say to Mykola is saved on the server. The conversation lives only in your browser.

Either way, Mykola's answers are written by **Claude**, an AI made by Anthropic, so what you type is sent to Anthropic to produce the reply (see *What is sent to other services*). Please do not tell Mykola anything you would not want written down: a password, an address, anything private about somebody else.

Who can read it

The person who runs the site can read everything stored on the server, including saved conversations with Mykola. They read it to fix problems and to improve the app, not to watch anybody. **Nobody else can**, and **nothing is sold, shared for advertising or used to show you adverts**. There are no adverts.

When you first sign in, the site's owner is sent a short email saying that a new account was made: its number, your first name, the time, and a shortened form of your address, such as

an***@gmail.com. It is sent once, not each time you come back.

Other learners never see your answers, your conversations or your settings. They see only the cards you added to public topics.

Teachers cannot see your progress, either: there is no teacher view.

What is sent to other services

To do its work, the site passes some things to a few services:

- **Anthropic (Claude)** receives:
- your messages to Mykola, and the first name he calls you by;
- the words you look up, to translate them;
- the words and the instruction you give when generating a text or building a topic;
- lines from notes you upload that need splitting.

Anthropic uses them to produce the answer.

- **Google** handles signing in. It knows you signed in to KuantorFlow; the site receives only your name, email address and account number. Google's Gmail also delivers the site's emails to its owner, described under *Who can read it*.
- **Oxford Learner's Dictionaries** and **Wiktionary** receive the word being looked up, and nothing else.

The site itself runs on PythonAnywhere, which stores the database and the files described above.

Deleting it

Delete account, in *Settings*, removes your account and, with it:

- your saved conversations with Mykola;
- your settings;
- the record of your answers and the words scheduled for you.

It asks first whether your cards should go with you or stay in the shared deck.

The activity logs are not rewritten when you delete your account. The lines that mention you are deleted along with everything else in those logs, within about a year.

Reset Auth signs you out and clears what this browser has stored, including your conversation with Mykola.

There is no separate button yet for deleting only your saved conversations while keeping the account. If you want that, ask the site's owner and it will be done by hand.

To ask about your data, or to have something removed — your conversations, or the activity log lines about you — write to the address under Who made it, and how to get in touch, at the end of this guide.

The idea behind it

A card here is a **lexical entry**, not a word-and-translation pair. The translation is a fast bridge into memory; the English definition and a real dictionary example then make you handle the word in English, and both stay on the card long after the translation stops being necessary — which is why

you can hide the translations once they are in the way. The deck is made of words *you* met, in the topics you chose, and vocabulary met in real life is remembered far better than somebody else's list.

About KuantorFlow

Who made it, and how to get in touch

KuantorFlow is made by **Anton Kuznietsov** using Claude Code. Questions, problems and ideas for the site are welcome at anton.kuznietsov@gmail.com.

The source code is public on GitHub: github.com/Kuantor/kuantorflow.

Anton's other projects and demos, and a short biography under *About Me*, are on his website: kuantor.github.io.
